Recap

Introduction

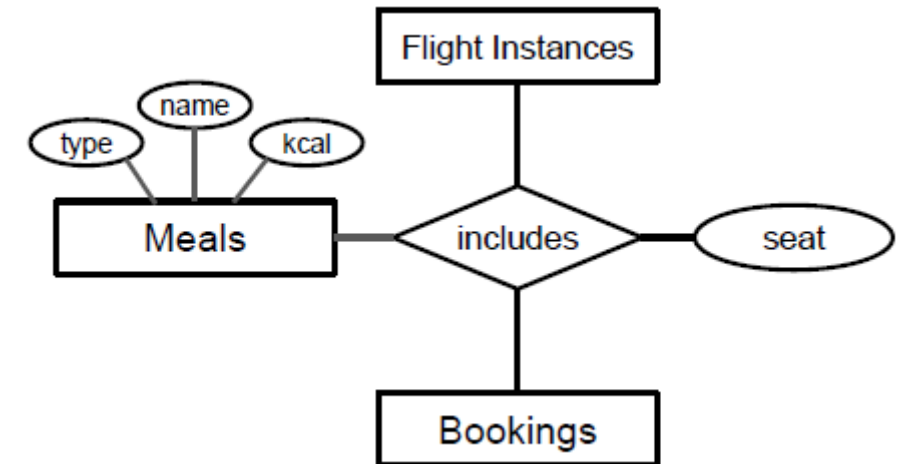

All data is described in terms of **entities (object)** and **relationships**.

Entities and relationships both have **attributes** which describe them, mainly:

1. Key Attribute (Underline)
2. Composite Attribute: *Consists of ≥ 1 Attribute* (Set of Attributes)
3. Multivalued Attribute *Consists of ≥ 1 Value* (Double-Dashed)
4. Derived Attribute: *Derived from other Attributes* (Dashed Oval)

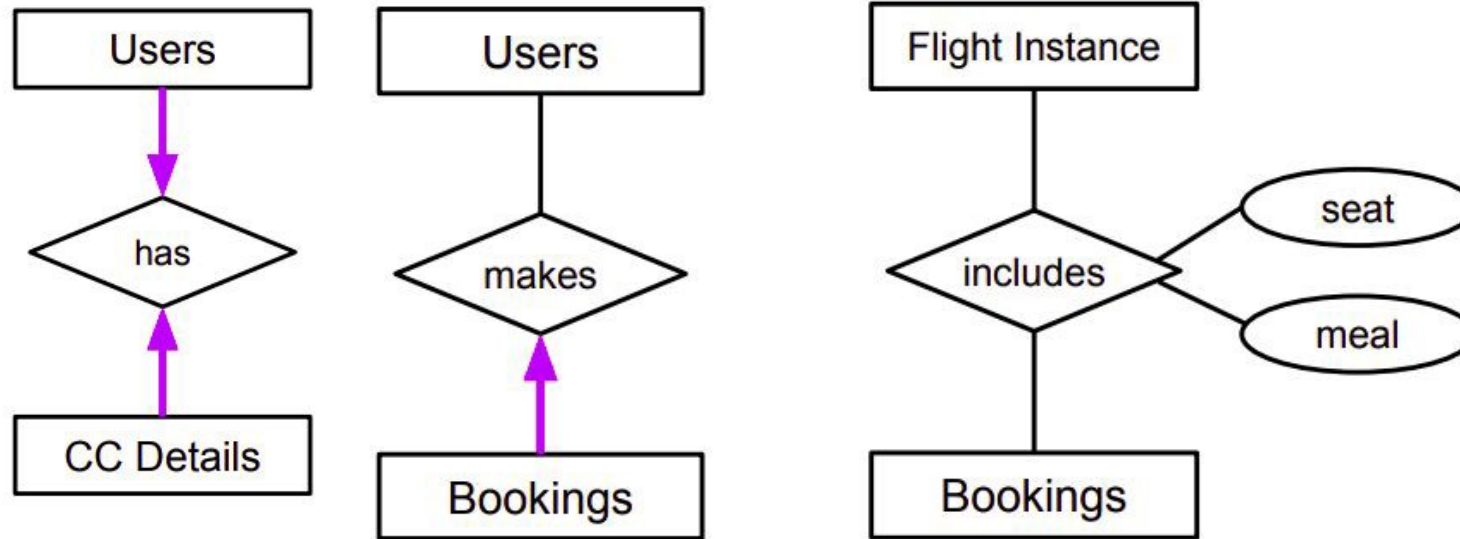

Relationships can be:

1. Binary (Two Entities)
2. Ternary (Three Entities)
3. Quaternary (Four Entities)

Cardinality Constraints

One-to-One, Many-to-One, Many-to-Many

Participation Constraints

Dependency Constraints

Weak Entities:

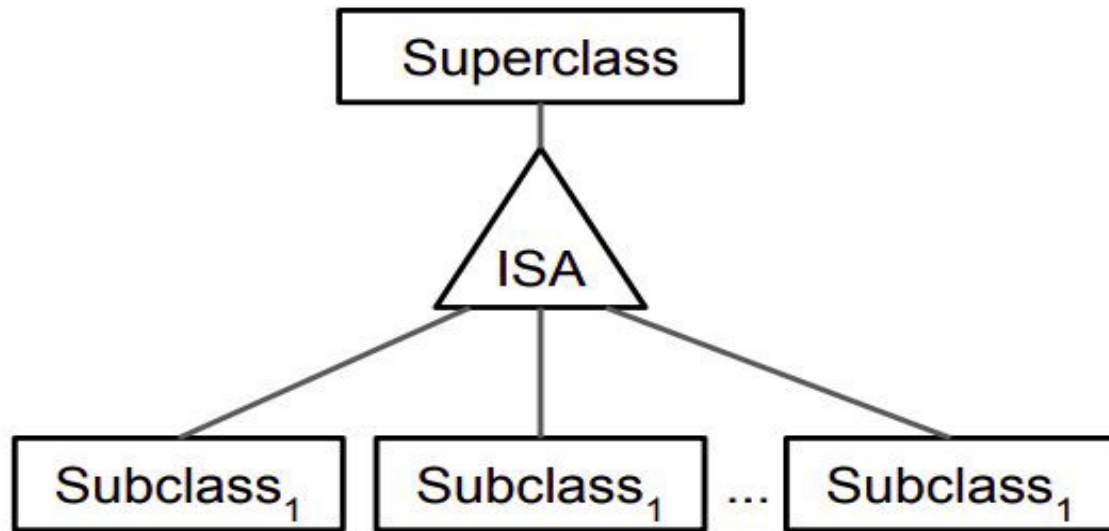

1. Its existence depends on its owner's existence
2. Doesn't have its own key. Given a flight (e.g. SQ231), the date identifies the exact instance of that flight

IS-A Hierarchies

Used to model generalization / specialization

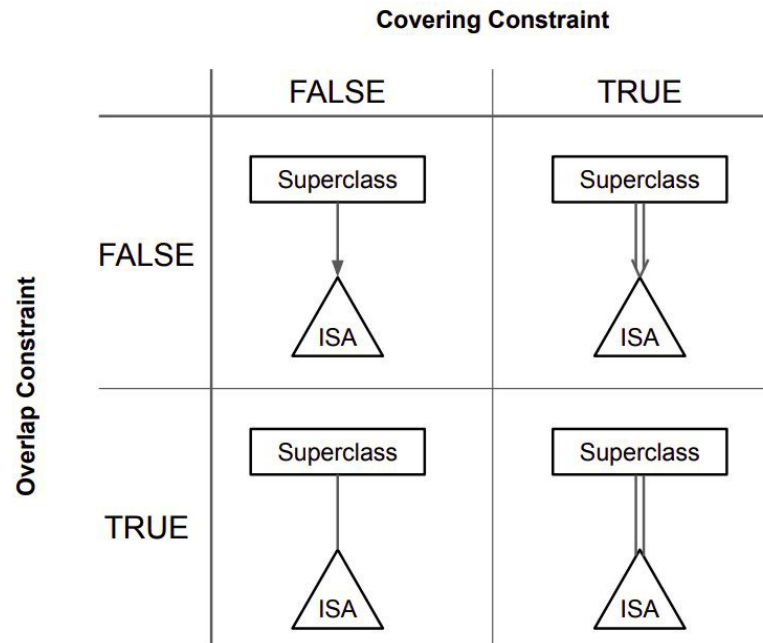

Subclass₁ is a form of Superclass

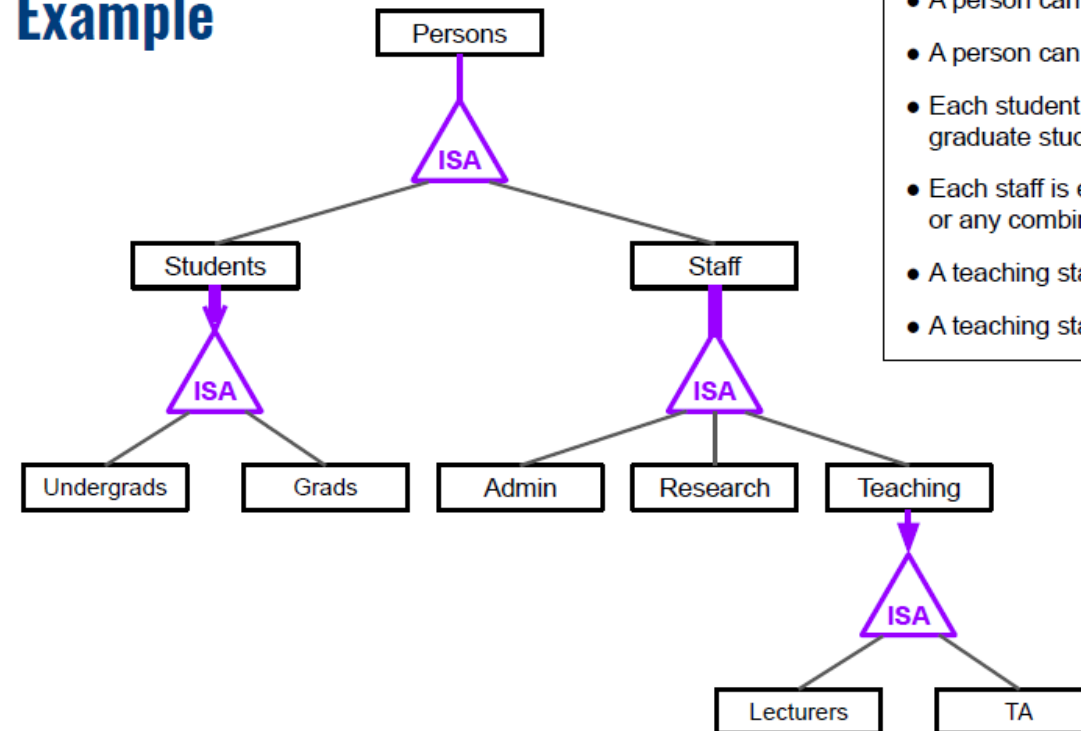

IS-A Hierarchies

Overlap: Superclass entity can belong to multiple subclasses

Covering: Superclass must belong to a specific subclass

Example

- A person can be both a student and staff
- A person can be neither a student or staff
- Each student is either a undergraduate or a graduate student (but definitely one of both)
- Each staff is either *admin*, *research*, *teaching* or any combination of these three roles
- A teaching staff cannot be a lecturer and TA
- A teaching staff can be neither lecturer or TA

Aggregation

Think of relationships as **higher-level entities**

Aka, treat your relationship as an entity

Summary

```
-- Employees(id: integer, username: text, age: integer,  
    user_role: text)
```

```
CREATE TABLE Employees ( -- Table Name  
    id INTEGER, -- Attribute Name + Attribute Domain  
    username TEXT,  
    age INTEGER,  
    user_role TEXT  
);
```
